Lab Experiment - 2

Implement echo client server using TCP sockets

AIM:-

To Implement echo client server using TCP sockets.

Program:

Server code:

```
Import socket
server = socket.socket()
Server.bind(("127.0.0.1", 5000))
Server.listen(1)
Print("server waiting.....")
client, address = server.accept()
Print("client connected")
while True:
    msg = client.recv(1024).decode()
if msg.lower() == "quit":
break
Print("client:", msg)
Client.send(("server recieved:" +msg).encode()
client.close()
Server.close()
```

Now, we need to write the code for the client code where now server is finished.

client code:

```
import socket
client = socket.socket()
client.connect(("127.0.0.1", 5000))
print("connected to server")
while True:
    msg = input("enter message: ")
    client.send(msg.encode())
    if msg.lower() == "quit":
        break
response = client.recv(1024).decode()
print("server:", response)
client.close()
```

INPUT :-

enter message : Hello
enter message : How are you?
enter message : quit

OUTPUT :-

server : server waiting ... Client
Client connected
Client : Hello
Client : How are you?

Now;

Here Client : connected to server.

Server: Server received: Hello
Server: Server received: How are you?

Result:-

Thus, tcp echo client-server was successfully implemented and tested.
