Study of Network cables

AIM:-

Understand & study of different types of Network cables.

Description:-

This experiment was conducted to study the construction and use of straight-through and crossover twisted pair cables. The color coding standards (T568A and T568B) were followed to prepare the cables using RJ45 connectors and a crimping tool. The prepared cables were tested to verify proper network connectivity b/w devices.

1) Difference b/w cross cable & straight cable.

straight cable: used to connect different devices

ex:- PC to switch/Router

cross cable: used to connect similar devices

ex:- PC to PC or switch to switch.

The straight cables are most commonly used ethernet cable in LANs.

2) The type of cable is used to connect two PCs are cross cable. The cross cable is commonly used to connect PC to PC, switch to switch, or Router to Router.

3) Type of cable used to connect a router/switch to your PC?

The straight cable is used to connect a router/switch to your PC.

4) the category of twisted pair cable in the lab to connect the PC to the network socket.

CAT 6 UTP – category 6 unshielded twisted pair is the twisted pair cables used lab

5) Learned to arrange wires in the correct T568A/T568B color sequence and crimp the RJ45 connector.

6) challenges faced is where arranging the wires correctly and crimping the connector

4) The cable was successfully prepared and network connectivity was verified using a cable tester or by connecting devices.

Result:-

The straight & crossover cables were successfully prepared and tested.
